Question 21.7 Figure Q21.7 shows some of the electric field lines due to three point charges arranged along the vertical axis. All three charges have the same magnitude.

- What are the signs of the three charges? Explain your reasoning.
- At what point(s) is the magnitude of the electric field the smallest? Explain your reasoning. Explain how the fields produced by each individual point charge combine to give a small net field at this point or points.

Question 21.16 A proton is placed in a uniform electric field and then released. Then an electron is placed at this same point and released. Do these particles experience the same force? The same acceleration? Do they move in the same direction when released?

Question 21.22 The electric field at point P due to the positive charges q_1 and q_2 are shown in Fig. Q21.22. Does the fact that they cross each other violate the statement in Section 21.6 that electric field lines never cross? Explain.

Problem 21.69 A charge $+Q$ is located at the origin, and a charge $+4Q$ is at distance d away on the x -axis. Where should a third charge, q , be placed, and what should be its sign and magnitude, so that all three charges will be in equilibrium?

Question 21.74 Two tiny spheres of mass 6.80 mg carry charges of equal magnitude, 72.0 nC , but opposite sign. They are tied to the same ceiling hook by light strings of length 0.530 m . When a horizontal uniform electric field E that is directed to the left is turned on, the spheres hang at rest with the angle θ between the strings equal to 50.0° (Fig. P21.74).

- Which ball (the one on the right or the one on the left) has positive charge?
- What is the magnitude E of the field?

Problem 21.87 A thin disk with a circular hole at its center, called an *annulus*, has inner radius R_1 and outer radius R_2 (Fig. P21.87). The disk has a uniform positive surface charge density σ on its surface.

- Determine the total electric charge on the annulus.
- The annulus lies in the yz -plane, with its center at the origin. For an arbitrary point on the x -axis (the axis of the annulus), find the magnitude and direction of the electric field \mathbf{E} . Consider points both above and below the annulus.
